

Wizard for pasting Data

Table name:

Options

- ☒ Definition and data
- ☐ Definition
- ☐ As table view
- ☐ Append data
- ☒ Use first line as column names
- ☐ Create new field as primary key

Name:

Existing data fields can be set as primary key on the type formatting step (third page) of the wizard.

Open a database.

Copy a table.

Right mouse click → Paste

Dialog appears

Change → "Table name:" to a name for a new table.

You could switch between

- Definition and data
- Definition
- As table view
- Append data (**Bug:** This isn't possible, because the table doesn't exist)

You couldn't choose "Create new field as primary key" (**Bug:** This must be possible for new tables, because you couldn't add data to a table without primary key. Behavior is the same when importing tables from Calc, and the data in Calc won't be identified by a unique field.)

Table name:

Options

☐ Definition and data

☐ Definition

☒ As table view

☐ Append data

☒ Use first line as column names

☐ Create new field as primary key

Name:

Existing data fields can be set as primary key on the type formatting step (third page) of the wizard.

Choose any option.

Only together with "As table view" "Create new field as primary key" will be available. **Bug:** Table views aren't writable at all. A primary key couldn't be added to a view, because a view is a query, which is saved in database directly. So this won't be executed and no new field would be added to the created view.
