

on the photo included as an attachment, you see the keyboard where there are 2 places for the numbers. Those at the top of the keyboard, and those to the right called Keys pad. If I change cell amounts from the numbers at the top of the keyboard, it doesn't work, even if I put the \$ sign, but on the other hand it works very well if I use the Key pad.

On a laptop with a 15.6" screen, there is no key pad, only the top numbers and it doesn't work anymore. Watching the video in the attached link, here's what happens.

Step 1: I change an amount in a cell where you will notice the malfunction, and see the formatting of this cell: the amount displayed does not have a \$. Then I put everything back in order, and review the formatting again where the amount has found the \$ sign

Step 2: I repeat step 1 on another cell without going to look at the formatting of this cell again and also see the result which is similar.
